

# Hive PRD - DevCareer x Nomba Hackathon

## Vision

Hive is an AI employee that lives inside WhatsApp and enables African SMEs to run their businesses entirely through conversation. Instead of learning dashboards, merchants simply chat with Hive to manage products, customers, orders, inventory and payments.

## Problem

African SMEs rely heavily on WhatsApp and manual processes for sales, payment confirmation, inventory and customer management. Existing commerce platforms require learning new software and are poorly suited to informal businesses.

## Solution

Hive turns WhatsApp into a business operating system. Merchants add products, update prices, generate invoices, create payment links, monitor sales, track customers and receive insights using natural language. Customers browse, order and pay directly through WhatsApp.

## Core MVP

AI Business Employee; AI product onboarding from images; Customer ordering flow; Nomba payment links and webhooks; Analytics dashboard.

## Nomba Integration

Payment Links, Payment Collection, Webhooks, with future support for Virtual Accounts, Transfers and Split Settlements. Payment confirmation automatically updates inventory, order status and receipts.

## Tech Stack

React, TypeScript, Tailwind CSS, Node.js, Express, PostgreSQL, Prisma, Redis, WhatsApp Cloud API, OpenAI/Gemini, Cloudinary, Docker, Render/Vercel.

## Demo

Merchant creates a store by chatting with Hive, uploads product images, customer purchases through WhatsApp, Hive generates a Nomba payment link, payment webhook confirms success, inventory updates automatically and both parties receive notifications.

## Vision Statement

Today, Hive is an AI employee. Tomorrow, Hive becomes the operating system for African commerce.
